DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-3 and 5-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Cumbie US Patent No. 6,960,201 in view of Patel US Patent No. 5,738,678.

Cumbie discloses a method and apparatus for treating nail infection, such as onychomycosis (see col. 8, lines 6-8), comprising: directing a UV light source **10** and associated UV transmissive cover **18** at the area of the body **16** to be treated; and irradiating said area with a UV light in the wavelength range of 254 nm for a predetermined time (see Fig. 1; col. 7, lines 8-15; and col. 8, lines 58-60).

However, although Cumbie teaches a UV transmissive cover, his cover is not connected to the light source or the supporting handpiece. Cumbie fails to teach the use of a safety sensor, such as a pressure sensor or a capacitive sensor that prevents a premature or unintended irradiation. However, the use of a safety sensor to control the commencing and/or ceasing of the treatment radiation is well known in the medical art. Patel discloses a medical device in which a pressure sensor controls the release and/or termination of a treatment light (see col. 6, lines 18-23). Therefore, at the time of the applicant's invention, it would have been obvious to one skilled in the art to modify the apparatus of Cumbie and incorporate a safety sensor, such as pressure sensor, into the

handpiece so as to control the firing of the light source. This would enhance the safety of the system.
